Water Resources Series No. 27

WATER RESOURCE OBSERVATORY
CLIMATOLOGICAL DATA
WATER YEAR 1971

March 1972

Abstract

Temperature and relative humidity data that have been reduced from hygrothermograph charts and precipitation data from recording and non-recording precipitation gages are presented in tabular form. Four readings per day at 0600, 1200, 1800 and 2400 hours and the maximum and minimum are presented. The mean, maximum, and minimum temperatures are also shown graphically. The reduced data are transferred to punch cards for computation and tabulating by the University of Wyoming's digital computer. The card format and computer program are presented in WyoWRRRI Water Resources Series No. 8.

KEY WORDS: /Data processing/ Climatological data/

ACKNOWLEDGMENTS

Funds for the instrumentation and the resultant gathering, reduction and processing of the data presented herein have been furnished by the Office of Water Resources Research of the Department of the Interior under the annual allotment to the Wyoming Water Resources Research Institute.

The data in this report were gathered by students at the University of Wyoming under the direction of a group of co-principal investigators coordinated by Paul A. Rechard, Director of the Wyoming Water Resources Research Institute.

Students at the University of Wyoming regularly visited the instruments, maintained them, changed charts or took readings. Louis E. Allen, a graduate student in Civil Engineering, and Alan H. Sullivan supervised this operation. Those students who have assisted include:

Ronald B. Abbott, Jimmie L. Allen, Louis R. Bartos, Roy Brewer, H. Royal Brooking, Kin-Fai Chan, William R. Good, Lloyd Hashimoto, Joe Kisicki, David E. Lewis, Dennis R. McCown, Phillip Rosendahl, James Reynolds, Manmohan Singh, and Theodore J. Swartz.

Verne E. Smith, Research Engineer with WyoWRRI, coordinated the reduction, compilation and processing of the data for this report.

INTRODUCTION

The Wyoming Water Resources Research Institute has underway an interdisciplinary research project entitled "Water Resource Operations Study", funded by a grant from the Office of Water Resources Research Act of 1964, Public Law 88-379.

One portion of the study is an investigation of bio-physical relationships in the hydrologic cycle. To undertake this portion, the WyoWRRRI utilized most of the initial year's (FY 1965) allotment to purchase instruments and equipment for the observation of several of the physical parameters related to the hydrologic cycle. The instrumentation was installed within the Snowy Range Water Resource Observatory near Laramie, which was selected for its ready accessibility and because there were already many single discipline studies, including agricultural, botanical, engineering, forestry, geological, weather modification, and zoological underway within the area, which added to the insight of the functioning of the Observatory. These studies also provided attendant instrumentation, especially that by the Atmospheric Resource Division of the Natural Resources Research Institute (NRRI) of the College of Engineering under contract with the U. S. Bureau of Reclamation, for weather modification studies for Snowpack Augmentation.

The investigators in the study group working on the overall problem of the bio-physical relationships decided that the study should be approached initially through single disciplinary studies to confirm, by use-test, the desires of each discipline for specific instrumentation; utilization of another's installation was encouraged to the maximum extent possible. Following this work and still concurrent with it, the group is attempting to develop a hydrologic model of a mountain watershed ecosystem.

A vital part of the interdisciplinary utilization of the instruments is the availability of the data obtained from them. The initial task of the investigators was to determine which items of data were important and how to present them. It was decided that the data as collected should be published in a form which could be made available to anyone interested.

This report is designed to accomplish that desired result for two types of instruments. Other types of data and subsequent years will be published in a similar manner. The water year (October 1 through September 30) was chosen as the period for reporting, to be compatible with the streamflow data published by the United States Geological Survey.

The first type of instrument considered was the hygrothermograph which continuously records temperature and relative humidity. It was agreed, for the analyses which could be anticipated, that publishing the record of temperature and relative humidity at 6-hour intervals, 0600, 1200, 1800, and 2400 hours, would suffice. The information at other hours could be obtained, if desired, from the charts which will be a part of the permanent office record. The chances are remote that the maximum or minimum daily temperature would occur at one of the selected hours, so it was decided to also tabulate these data and the time of their occurrence. The mean daily temperature was computed as the average of the daily extremes. The maximum or minimum values of relative humidity were not deemed to be as important as the relative humidity at the time of maximum or minimum temperature.

Because in most instances a non-recording precipitation gage was installed at the same site as a hygrothermograph, daily precipitation was included on the table.

The data from the charts were reduced to ADP punch cards and a program written to present the data in table form and to plot the mean and extremes of daily temperature. The card formats and the program were included in the initial year's report (Water Resources Series No. 8).

The computer program was written to convert the relative humidity readings to dew-point temperatures and vapor pressure deficits. Since these conversions involve a form of analysis, it was decided that the information would not be published herein. If the other forms of information are desired, they may be obtained by contacting the WRRRI Institute.

The sites at which most of the WyoWRRI instruments are installed are indicated on the maps on Pages 9 and 10. A listing of the instrumentation at each site and a brief description of the site are given on Pages 11, 12, and 13.

In order to present the data for general use, the WyoWRRI publishes the basic data obtained from its instruments by water years. Water Resources Series No. 8 presented the climatic data from the time of installation through year 1966. Water Resources Series Nos. 12, 14, 17, and 23 presented the climatic data for water years 1967, 1968, 1969, and 1970 respectively. This publication presents the data for water year 1971. Data for subsequent water years will be published in succeeding series.

ERRATA ON PREVIOUS CLIMATOLOGICAL PUBLICATIONS

Several errors in the climatological data that have been published previously have come to our attention. The corrected values are:

Station 0102
